

Problem

Give unambiguous CFGs for the following languages.

- a. $\{w \mid \text{in every prefix of } w \text{ the number of } a\text{'s is at least the number of } b\text{'s}\}$
- b. $\{w \mid \text{the number of } a\text{'s and the number of } b\text{'s in } w \text{ are equal}\}$
- c. $\{w \mid \text{the number of } a\text{'s is at least the number of } b\text{'s in } w\}$

Step-by-step solution

Step 1 of 4

First step is finding a grammar for finding an unambiguous CFG whether it is ambiguous or unambiguous.

- Grammar for the given problem is

$$\begin{aligned} S &\rightarrow SS(S) \mid \varepsilon \\ S &\rightarrow a \mid b \end{aligned}$$

- But the given grammar is ambiguous as there is more than one parse tree is possible for the above grammar.
- After finding the grammar finds that whether it is ambiguous or not.
- If the grammar is ambiguous then set some priority rules for selecting derivation tree for the grammar and after that set production rules for the grammar.
- Now after setting some priority rules the grammar can be:

$$\begin{aligned} S &\rightarrow (S)S \mid \varepsilon \\ S &\rightarrow a \mid b \end{aligned}$$

- But this is also wrong grammar as in this grammar for every prefix of any input string w the number of a 's does not at least the number of b 's.
- Final grammar in which for every prefix of any input string w the number of a 's is at least the number of b 's is as shown:

$$\begin{aligned} S &\rightarrow (S)S(S) \mid \varepsilon \\ S &\rightarrow a \mid b \end{aligned}$$

[Comment](#)

Step 2 of 4

a)

The input alphabet a is prefixes at least the number of b 's that means if the length of the input string is one then that must be a .

For the two or more inputs the possible strings are aa , ab , aaa , aab and so on.

So, the unambiguous grammar (CFG) is given below:

$$S \rightarrow aS \mid a \mid b \mid \varepsilon$$

The production for a regular expression $aaab$.

$$\begin{aligned} S &\rightarrow aS \\ &\rightarrow aaS \\ &\rightarrow aaaS \\ &\rightarrow aaab \end{aligned}$$

This grammar is an unambiguous grammar because there is no possible way to get same regular expression.

Step 3 of 4

b)

Consider the following unambiguous CFG:

$$S \rightarrow aSb \mid bSa \mid \varepsilon$$

In the above grammar, production rules $S \rightarrow aSb$ and $S \rightarrow bSa$ generates the equal number of terminals a's and b's.

$$S \rightarrow aSb$$

$$\rightarrow a(aSb)b$$

$$\rightarrow aa(aSb)bb$$

$$\rightarrow aaabbb$$

[Comments \(5\)](#)

Step 4 of 4

c)

In the given question, the number a 's is at least the number of b 's that means for a single character input a must be the input alphabet.

Consider the following unambiguous CFG:

$$S \rightarrow aSb \mid bSa \mid aS \mid \varepsilon$$

- In the above grammar, production rules $S \rightarrow aSb$ and $S \rightarrow bSa$ generates the equal number of terminals a 's and b 's.
- The production rule $S \rightarrow aS$ is used for generating the terminal a 's as many as user wants.
- The production rule $S \rightarrow \varepsilon$ is used for generating the equal number of terminals a 's and b 's.

$$S \rightarrow aSb \mid bSa \mid aS \mid \varepsilon$$

$$\rightarrow a(aSb)b$$

$$\rightarrow aa(bSa)bb$$

$$\rightarrow aababb$$
