

## Homework 6 Solutions

1. Give pushdown automata that recognize the following languages. Give both a drawing and 6-tuple specification for each PDA.

(a)  $A = \{ w \in \{0, 1\}^* \mid w \text{ contains at least three 1s} \}$

**Answer:**

We formally express the PDA as a 6-tuple  $(Q, \Sigma, \Gamma, \delta, q_1, F)$ , where

- $Q = \{q_1, q_2, q_3, q_4\}$
- $\Sigma = \{0, 1\}$
- $\Gamma = \{0, 1\}$
- transition function  $\delta : Q \times \Sigma_\epsilon \times \Gamma_\epsilon \rightarrow \mathcal{P}(Q \times \Gamma_\epsilon)$  is defined by

Input:	0			1			$\epsilon$		
Stack:	0	1	$\epsilon$	0	1	$\epsilon$	0	1	$\epsilon$
$q_1$			$\{(q_1, \epsilon)\}$			$\{(q_2, \epsilon)\}$			
$q_2$			$\{(q_2, \epsilon)\}$			$\{(q_3, \epsilon)\}$			
$q_3$			$\{(q_3, \epsilon)\}$			$\{(q_4, \epsilon)\}$			
$q_4$			$\{(q_4, \epsilon)\}$			$\{(q_4, \epsilon)\}$			

Blank entries are  $\emptyset$ .

- $q_1$  is the start state
- $F = \{q_4\}$

Note that  $A$  is a regular language, so the language has a DFA. We can easily convert the DFA into a PDA by using the same states and transitions and never push nor pop anything to/from the stack.

(b)  $B = \{w \in \{0, 1\}^* \mid w = w^R \text{ and the length of } w \text{ is odd}\}$

**Answer:**

Since the length of any string  $w \in B$  is odd,  $w$  must have a symbol exactly in the middle position; i.e.,  $|w| = 2n + 1$  for some  $n \geq 0$ , and the  $(n + 1)$ th symbol in  $w$  is the middle one. If a string  $w$  of length  $2n + 1$  satisfies  $w = w^R$ , the first  $n$  symbols must match (in reverse order) the last  $n$  symbols, and the middle symbol doesn't have to match anything. Thus, in the above PDA, the transition from  $q_2$  to itself reads the first  $n$  symbols and pushes these on the stack. The transition from  $q_2$  to  $q_3$  nondeterministically identifies the middle symbol of  $w$ , which doesn't need to match any symbol, so the stack is unaltered. The transition from  $q_3$  to itself then reads the last  $n$  symbols of  $w$ , popping the stack at each step to make sure the symbols after the middle match (in reverse order) the symbols before the middle.

We formally express the PDA as a 6-tuple  $(Q, \Sigma, \Gamma, \delta, q_1, F)$ , where

- $Q = \{q_1, q_2, q_3, q_4\}$
- $\Sigma = \{0, 1\}$
- $\Gamma = \{0, 1, \$\}$  (use  $\$$  to mark bottom of stack)
- transition function  $\delta : Q \times \Sigma_\epsilon \times \Gamma_\epsilon \rightarrow \mathcal{P}(Q \times \Gamma_\epsilon)$  is defined by

Input:	0				1				$\epsilon$			
Stack:	0	1	\$	$\epsilon$	0	1	\$	$\epsilon$	0	1	\$	$\epsilon$
$q_1$												$\{(q_2, \$)\}$
$q_2$				$\{(q_2, 0), (q_3, \epsilon)\}$				$\{(q_2, 1), (q_3, \epsilon)\}$				
$q_3$	$\{(q_3, \epsilon)\}$					$\{(q_3, \epsilon)\}$					$\{(q_4, \epsilon)\}$	
$q_4$												

Blank entries are  $\emptyset$ .

- $q_1$  is the start state
- $F = \{q_4\}$

(c)  $C = \{w \in \{0, 1\}^* \mid w = w^R\}$

**Answer:**

The length of a string  $w \in C$  can be either even or odd. If it's even, then there is no middle symbol in  $w$ , so the first half of  $w$  is pushed on the stack, we move from  $q_2$  to  $q_3$  without reading, pushing, or popping anything, and then match the second half of  $w$  to the first half in reverse order by popping the stack. If the length of  $w$  is odd, then there is a middle symbol in  $w$ , and the description of the PDA in part (b) applies.

We formally express the PDA as a 6-tuple  $(Q, \Sigma, \Gamma, \delta, q_1, F)$ , where

- $Q = \{q_1, q_2, q_3, q_4\}$
- $\Sigma = \{0, 1\}$
- $\Gamma = \{0, 1, \$\}$  (use  $\$$  to mark bottom of stack)
- transition function  $\delta : Q \times \Sigma_\epsilon \times \Gamma_\epsilon \rightarrow \mathcal{P}(Q \times \Gamma_\epsilon)$  is defined by

Input:	0				1				$\epsilon$			
Stack:	0	1	\$	$\epsilon$	0	1	\$	$\epsilon$	0	1	\$	$\epsilon$
$q_1$												$\{(q_2, \$)\}$
$q_2$				$\{(q_2, 0), (q_3, \epsilon)\}$				$\{(q_2, 1), (q_3, \epsilon)\}$				$\{(q_3, \epsilon)\}$
$q_3$	$\{(q_3, \epsilon)\}$					$\{(q_3, \epsilon)\}$					$\{(q_4, \epsilon)\}$	
$q_4$												

Blank entries are  $\emptyset$ .

- $q_1$  is the start state
- $F = \{q_1, q_4\}$

(d)  $D = \{a^i b^j c^k \mid i, j, k \geq 0, \text{ and } i = j \text{ or } j = k\}$

**Answer:**

The PDA has a nondeterministic branch at  $q_1$ . If the string is  $a^i b^j c^k$  with  $i = j$ , then the PDA takes the branch from  $q_1$  to  $q_2$ . If the string is  $a^i b^j c^k$  with  $j = k$ , then the PDA takes the branch from  $q_1$  to  $q_5$ .

We formally express the PDA as a 6-tuple  $(Q, \Sigma, \Gamma, \delta, q_1, F)$ , where

- $Q = \{q_1, q_2, \dots, q_8\}$
- $\Sigma = \{a, b, c\}$
- $\Gamma = \{a, b, \$\}$  (use  $\$$  to mark bottom of stack)
- transition function  $\delta : Q \times \Sigma_\epsilon \times \Gamma_\epsilon \rightarrow \mathcal{P}(Q \times \Gamma_\epsilon)$  is defined by

Input:	a					b					c					$\epsilon$				
Stack:	a	b	c	\$	$\epsilon$	a	b	c	\$	$\epsilon$	a	b	c	\$	$\epsilon$	a	b	c	\$	$\epsilon$
$q_1$																				
$q_2$					$\{(q_2, a)\}$															$\{(q_2, \$), (q_5, \$)\}$
$q_3$						$\{(q_3, \epsilon)\}$														$\{(q_3, \epsilon)\}$
$q_4$															$\{(q_4, \epsilon)\}$					$\{(q_4, \epsilon)\}$
$q_5$					$\{(q_5, \epsilon)\}$															$\{(q_5, \epsilon)\}$
$q_6$										$\{(q_6, b)\}$										$\{(q_6, \epsilon)\}$
$q_7$											$\{(q_7, \epsilon)\}$									$\{(q_7, \epsilon)\}$
$q_8$																				$\{(q_8, \epsilon)\}$

Blank entries are  $\emptyset$ .

- $q_1$  is the start state
- $F = \{q_4, q_8\}$

(e)  $E = \{a^i b^j c^k \mid i, j, k \geq 0 \text{ and } i + j = k\}$

Answer:

For every  $a$  and  $b$  read in the first part of the string, the PDA pushes an  $x$  onto the stack. Then it must read a  $c$  for each  $x$  popped off the stack.

We formally express the PDA as a 6-tuple  $(Q, \Sigma, \Gamma, \delta, q_1, F)$ , where

- $Q = \{q_1, q_2, \dots, q_5\}$
- $\Sigma = \{a, b, c\}$
- $\Gamma = \{x, \$\}$  (use  $\$$  to mark bottom of stack)
- transition function  $\delta : Q \times \Sigma_\epsilon \times \Gamma_\epsilon \rightarrow \mathcal{P}(Q \times \Gamma_\epsilon)$  is defined by

Input:	a			b			c			$\epsilon$		
Stack:	x	\$	$\epsilon$	x	\$	$\epsilon$	x	\$	$\epsilon$	x	\$	$\epsilon$
$q_1$												$\{(q_2, \$)\}$
$q_2$			$\{(q_2, x)\}$									$\{(q_3, \epsilon)\}$
$q_3$						$\{(q_3, x)\}$						$\{(q_4, \epsilon)\}$
$q_4$							$\{(q_4, \epsilon)\}$				$\{(q_5, \epsilon)\}$	
$q_5$												

Blank entries are  $\emptyset$ .

- $q_1$  is the start state
  - $F = \{q_5\}$
- (f)  $F = \{a^{2n}b^{3n} \mid n \geq 0\}$

**Answer:**

The PDA pushes a single  $x$  onto the stack for every 2  $a$ 's read at the beginning of the string. Then it pops a single  $x$  for every 3  $b$ 's read at the end of the string.

We formally express the PDA as a 6-tuple  $(Q, \Sigma, \Gamma, \delta, q_1, F)$ , where

- $Q = \{q_1, q_2, \dots, q_7\}$
- $\Sigma = \{a, b\}$
- $\Gamma = \{x, \$\}$  (use  $\$$  to mark bottom of stack)
- transition function  $\delta : Q \times \Sigma_\epsilon \times \Gamma_\epsilon \rightarrow \mathcal{P}(Q \times \Gamma_\epsilon)$  is defined by

Input:	$a$			$b$			$\epsilon$		
Stack:	$x$	$\$$	$\epsilon$	$x$	$\$$	$\epsilon$	$x$	$\$$	$\epsilon$
$q_1$									$\{(q_2, \$)\}$
$q_2$			$\{(q_3, \epsilon)\}$						$\{(q_4, \epsilon)\}$
$q_3$			$\{(q_2, x)\}$						
$q_4$						$\{(q_5, \epsilon)\}$		$\{(q_7, \epsilon)\}$	
$q_5$						$\{(q_6, \epsilon)\}$			
$q_6$				$\{(q_4, \epsilon)\}$					
$q_7$									

Blank entries are  $\emptyset$ .

- $q_1$  is the start state
  - $F = \{q_7\}$
- (g)  $\emptyset$ , with  $\Sigma = \{0, 1\}$

**Answer:**

Because the PDA has no accept states, the PDA accepts no strings; i.e., the PDA recognizes the language  $\emptyset$ .

We formally express the PDA as a 6-tuple  $(Q, \Sigma, \Gamma, \delta, q_1, F)$ , where

- $Q = \{q_1\}$
- $\Sigma = \{0, 1\}$
- $\Gamma = \{x\}$
- transition function  $\delta : Q \times \Sigma_\epsilon \times \Gamma_\epsilon \rightarrow \mathcal{P}(Q \times \Gamma_\epsilon)$  is defined by

Input:	0	1	$\epsilon$
Stack:	$x$ $\epsilon$	$x$ $\epsilon$	$x$ $\epsilon$
$q_1$			

Blank entries are  $\emptyset$ .

- $q_1$  is the start state
  - $F = \emptyset$
- (h) The language  $H$  of strings of properly balanced left and right brackets: every left bracket can be paired with a unique subsequent right bracket, and every right bracket can be paired with a unique preceding left bracket. Moreover, the string between any such pair has the same property. For example,  $[[[[[]]]]] \in A$ .

**Answer:**

We formally express the PDA as a 6-tuple  $(Q, \Sigma, \Gamma, \delta, q_1, F)$ , where

- $Q = \{q_1, q_2, q_3\}$
- $\Sigma = \{[, ]\}$
- $\Gamma = \{[, \$\}$  (use  $\$$  to mark bottom of stack)
- transition function  $\delta : Q \times \Sigma_\epsilon \times \Gamma_\epsilon \rightarrow \mathcal{P}(Q \times \Gamma_\epsilon)$  is defined by

Input:	[		]		$\epsilon$	
Stack:	[	\$	$\epsilon$	[	\$	$\epsilon$
$q_1$						$\{(q_2, \$)\}$
$q_2$			$\{(q_2, [)\}$	$\{(q_2, \epsilon)\}$		$\{(q_3, \epsilon)\}$
$q_3$						

Blank entries are  $\emptyset$ .

- $q_1$  is the start state
- $F = \{q_3\}$

2. (a) Use the languages

$$\begin{aligned} A &= \{a^m b^n c^n \mid m, n \geq 0\} \text{ and} \\ B &= \{a^n b^n c^m \mid m, n \geq 0\} \end{aligned}$$

together with Example 2.36 of the textbook to show that the class of context-free languages is not closed under intersection.

**Answer:** The language  $A$  is context free since it has CFG  $G_1$  with rules

$$\begin{aligned} S &\rightarrow XY \\ X &\rightarrow aX \mid \varepsilon \\ Y &\rightarrow bYc \mid \varepsilon \end{aligned}$$

The language  $B$  is context free since it has CFG  $G_2$  with rules

$$\begin{aligned} S &\rightarrow XY \\ X &\rightarrow aXb \mid \varepsilon \\ Y &\rightarrow cY \mid \varepsilon \end{aligned}$$

But  $A \cap B = \{a^n b^n c^n \mid n \geq 0\}$ , which we know is not context free from Example 2.36 of the textbook. Thus, the class of context-free languages is not closed under intersection.

(b) Use part (a) and DeMorgan's law (Theorem 0.20 of the textbook) to show that the class of context-free languages is not closed under complementation.

**Answer:** We will use a proof by contradiction, so we first assume the opposite of what we want to show; i.e., suppose the following is true:

**R1.** The class of context-free languages is closed under complementation.

Define the context-free languages  $A$  and  $B$  as in the previous part. Then R1 implies  $\overline{A}$  and  $\overline{B}$  are context-free. We know the class of context-free languages is closed under union, as shown on slide 2-101, so we then must have that  $\overline{A \cup B}$  is context-free. Then again apply R1 to conclude that  $\overline{\overline{A \cup B}}$  is context-free. Now DeMorgan's law states that  $A \cap B = \overline{\overline{A \cup B}}$ , but we showed in the previous part that  $A \cap B$  is not context-free, which is a contradiction. Therefore, R1 must not be true.

3. Consider the following CFG  $G = (V, \Sigma, R, S)$ , where  $V = \{S, T, X\}$ ,  $\Sigma = \{a, b\}$ , the start variable is  $S$ , and the rules  $R$  are

$$\begin{aligned} S &\rightarrow aTXb \\ T &\rightarrow XTS \mid \varepsilon \\ X &\rightarrow a \mid b \end{aligned}$$

Convert  $G$  to an equivalent PDA using the procedure given in Lemma 2.21.

**Answer:** First we create a PDA for  $G$  that allows for pushing strings onto the stack:

Then we need to fix the non-compliant transitions, i.e., the ones for which a string of length more than 1 is pushed onto the stack. The only non-compliant transitions are the first two from  $q_2$  back to itself, and the transition from  $q_1$  to  $q_2$ . Fixing these gives the following PDA:

4. Use the pumping lemma to prove that the language  $A = \{0^{2n}1^{3n}0^n \mid n \geq 0\}$  is not context free.

**Answer:** Assume that  $A$  is a CFL. Let  $p$  be the pumping length of the pumping lemma for CFLs, and consider string  $s = 0^{2p}1^{3p}0^p \in A$ . Note that  $|s| = 6p > p$ , so the pumping lemma will hold. Thus, there exist strings  $u, v, x, y, z$  such that  $s = uvxyz = 0^{2p}1^{3p}0^p$ ,  $uv^i xy^i z \in A$  for all  $i \geq 0$ , and  $|vy| \geq 1$ . We now consider all of the possible choices for  $v$  and  $y$ :

- Suppose strings  $v$  and  $y$  are uniform (e.g.,  $v = 0^j$  for some  $j \geq 0$ , and  $y = 1^k$  for some  $k \geq 0$ ). Then  $|vy| \geq 1$  implies that  $j \geq 1$  or  $k \geq 1$  (or both), so  $uv^2xy^2z$  won't have the correct number of 0's at the beginning, 1's in the middle, and 0's at the end. Hence,  $uv^2xy^2z \notin A$ .
- Now suppose strings  $v$  and  $y$  are not both uniform. Then  $uv^2xy^2z$  will not have the form  $0 \cdots 01 \cdots 10 \cdots 0$ . Hence,  $uv^2xy^2z \notin A$ .

Thus, there are no options for  $v$  and  $y$  such that  $uv^i xy^i z \in A$  for all  $i \geq 0$ . This is a contradiction, so  $A$  is not a CFL.

5. The Turing machine  $M$  below recognizes the language  $A = \{0^{2^n} \mid n \geq 0\}$ .

In each of the parts below, give the sequence of configurations that  $M$  enters when started on the indicated input string.

- (a) 00

**Answer:**  $q_1 00 \quad \sqcup q_2 0 \quad \sqcup x q_3 \sqcup \quad \sqcup q_5 x \quad q_5 \sqcup x \quad \sqcup q_2 x \quad \sqcup x q_2 \sqcup \quad \sqcup x \sqcup q_{\text{accept}}$

(b) 000000

**Answer:**  $q_1 000000 \quad \sqcup q_2 00000 \quad \sqcup x q_3 0000 \quad \sqcup x 0 q_4 000$   
 $\sqcup x 0 x q_3 00 \quad \sqcup x 0 x 0 q_4 0 \quad \sqcup x 0 x 0 x q_3 \sqcup \quad \sqcup x 0 x 0 q_5 x \quad \sqcup x 0 x q_5 0 x$   
 $\sqcup x 0 q_5 x 0 x \quad \sqcup x q_5 0 x 0 x \quad \sqcup q_5 x 0 x 0 x \quad q_5 \sqcup x 0 x 0 x \quad \sqcup q_2 x 0 x 0 x$   
 $\sqcup x q_2 0 x 0 x \quad \sqcup x x q_3 x 0 x \quad \sqcup x x x q_3 0 x \quad \sqcup x x x 0 q_4 x \quad \sqcup x x x 0 x q_4 \sqcup$   
 $\sqcup x x x 0 x \sqcup q_{\text{reject}}$
